

## Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is actually a hydraulic device which allows the the one driving to maneuver the forklift without leaving the seat. They are constructed out of high quality materials and are designed to be able to withstand the most challenging operations and work surroundings. Side shifting models have the extra ability to be able to laterally position the entire load or the arms in order to facilitate much more precise lifting and placement in a faster and more efficient manner.

The blade pocket is somewhat unique and could enable the individual operating it to safely sway the blades into position without any worry of damaging the positioning cylinders. This could allow the driver the option to be able to perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be converted into blade positioners on available units.
